The batting title is determined in the following manner. This process was established unanimously by five old time Legends. First, a pool is created consisting of players who have at bats equal to or greater than 2X the number of games the team played in the regular season schedule (forfeited games are not considered played games). The three determining rules are as follows and they're in order. Once a champion is determined, there is no reason to go to the next rule.

1. Of that pool, if the player with the highest batting average has at bats at least 2.5X the number of games in the regular season, he is declared the batting champion.

2. Of that pool, if there are at least five players with at least 2.5X at bats, the person the highest 2.5X batting average is declared the batting champion.

3. Of that pool, if there are less than 5 players with 2.5X at bats, then the highest batting average of the entire pool is declared the batting champion.

Note: In determining the 2.5X figure, it must be a whole number. If it isn't, it is rounded up to the next whole number.
   (Example: if the season had 15 games, the 2.5X figure would be 38 not 37.5)
